

WHAT IS CLAIMED IS:

1        1. A method of measuring concentration of an optically  
2 active substance in the anterior chamber of an eye, comprising  
3 the steps of:

4                (a) guiding a polarized beam so it is generally  
5 parallel to an iris of the eye;

6                (b) introducing the beam into the anterior chamber  
7 such that it is refracted within the anterior chamber, impinges  
8 on the iris, is reflected therefrom, and then exits the anterior  
9 chamber approximately collinear with the beam immediately before  
10 the point at which it is introduced into the anterior chamber;

11               (c) guiding the beam exiting from the anterior chamber  
12 through an analyzer and onto a detector; and

13               (d) applying a signal to a polarization modulator to  
14 extinguish light passing from the analyzer to the detector, the  
15 signal representing the concentration of the optically active  
16 ingredient in the anterior chamber.

1           2. The method of Claim 1 including the step of adjusting  
2         the orientation of a portion of the beam incident on a cornea of  
3         the eye until a stable, substantially increased output signal  
4         level is produced by the detector.

1           3. The method of Claim 1 wherein the optically active  
2         substance includes glucose.

1           4. The method of Claim 1 including calibrating the  
2         analyzer to extinguish light passing from the analyzer to the  
3         detector before performing step (a).

1           5. The method of Claim 4 wherein step (d) includes  
2         simultaneously applying a DC signal and an AC signal to the  
3         polarization modulator to extinguish light of the beam to prevent  
4         it from passing from the analyzer to the detector by shifting the  
5         DC signal to a value that produces a null in the AC component of  
6         a corresponding output signal produced by the detector, the value  
7         of the shifted DC signal then representing the glucose  
8         concentration in the anterior chamber.

1           6. A method of measuring concentration of an optically  
2 active substance in the anterior chamber of an eye, comprising  
3 the steps of:

4                 (a) guiding a beam through a polarizer oriented in a  
5 first direction to polarize the light in a first direction, and  
6 then through a polarization modulator and an analyzer oriented in  
7 the second direction to polarize the light in a second direction,  
8 and then guiding the beam from the analyzer to a detector;

9                 (b) adjusting at least one of the polarizer and the  
10 analyzer to extinguish light of the beam to prevent it from  
11 passing from the analyzer to the detector;

12                 (c) guiding the beam, after it passes through the  
13 polarizer, so it is generally parallel to an iris of the eye and  
14 then introducing the beam into the anterior chamber such that it  
15 is refracted within the anterior chamber and impinges on the  
16 iris, is reflected therefrom, and then exits the anterior chamber  
17 approximately collinear with the beam immediately before the  
18 point at which it is introduced into the anterior chamber;

19                 (d) guiding the beam exiting from the anterior chamber  
20 onto the detector; and

21                 (e) modifying a signal applied to the polarization

22 modulator to extinguish light passing from the analyzer to the  
23 detector, the amount of modification of the signal representing  
24 the concentration of the optically active ingredient in the  
25 anterior chamber.

1       7. The method of Claim 6 including the step of adjusting  
2 the orientation of a portion of the beam incident on a cornea of  
3 the eye until a stable, substantially increased output signal  
4 level is produced by the detector.

1       8. The method of Claim 6 wherein the optically active  
2 substance includes glucose.

1       9. The method of Claim 6 wherein step (e) includes  
2 simultaneously applying a DC signal and an AC signal to the  
3 polarization modulator to extinguish light of the beam to prevent  
4 it from passing from the analyzer to the detector by shifting the  
5 DC signal to a value that produces a null in the AC component of  
6 a corresponding output signal produced by the detector, the value  
7 of the shifted DC signal then representing the glucose  
8 concentration in the anterior chamber.

1           10. The method of Claim 9 including applying the output  
2 signal to an input of a lock-in amplifier and determining that  
3 the null has been produced when a DC output of the lock-in  
4 amplifier is zero.

1           11. The method of Claim 6 wherein step (a) includes passing  
2 the beam through a quarter wave plate after it exits from the  
3 polarizer.

1           12. The method of Claim 6 including, before step (a),  
2 collimating light from a source to produce the beam.

1           13. The method of Claim 6 wherein the beam is  
2 monochromatic.

1           14. The method of Claim 6 wherein step (b) is performed  
2 before step (e).

1           15. The method of Claim 9 wherein the polarization  
2 modulator includes a Faraday rotator and wherein step (e)  
3 includes applying the DC signal with the AC signal superimposed  
4 thereon to a coil of the Faraday rotator.

1           16. The method of Claim 15 wherein the DC signal is a DC  
2 current having a value in the range of about 0.01 to 100  
3 milliamperes.

1           17. The method of Claim 16 wherein the AC signal is an AC  
2 current having a range in the value of about 0.01 to 10 amperes,  
3 to thereby reduce noise to the range of a few millivolts or less.

1           18. A system for measuring concentration of an optically  
2 active substance in an anterior chamber of the eye, comprising in  
3 combination:

4           (a) a light source producing a beam;

5           (b) a polarizer oriented in a first direction to

6        polarize light of the beam in a first direction;

7                (c)    a polarization modulator transmitting the beam  
8        after it has passed through the polarizer;

9                (d)    an analyzer polarizing light from the polarization  
10      modulator in a second direction;

11                (e)    a detector receiving light from the analyzer;

12                (f)    a first optical structure introducing the beam,  
13        after it passes through the polarizer, into the anterior chamber  
14      generally parallel to an iris of the eye so that the beam is  
15      refracted within the anterior chamber and impinges onto the iris,  
16      is reflected from the iris, and then exits the anterior chamber  
17      approximately collinear with the introduced beam;

18                (g)    a second optical structure receiving the beam  
19        after it exits the anterior chamber and guiding it to the  
20      detector; and

21                (h)    a polarization modulator control device coupled to  
22      a control terminal of the polarization modulator and operative to  
23      shift a DC bias signal applied to the polarization modulator to  
24      extinguish light of the beam to prevent it from passing from the  
25      analyzer to the detector.

1           19. The system of Claim 18 wherein the polarization  
2         modulator control device is operative to simultaneously apply a  
3         DC signal and an AC signal to the polarization modulator to  
4         extinguish any light passing through the analyzer to the detector  
5         by shifting the DC signal to a value that extinguishes any AC  
6         component of an output signal produced by the detector, the value  
7         of the shifted DC signal then representing the concentration of  
8         the optically active ingredient in the anterior chamber.

1           20. The system of Claim 18 wherein the optically active  
2         substance includes glucose.

1           21. The system of Claim 19 wherein the polarization  
2         modulator includes a Faraday rotator and the DC signal with the  
3         AC signal superimposed thereon is applied to a coil of the  
4         Faraday rotator.

1           22. The system of Claim 21 wherein the DC signal is a DC  
2         current having a value in the range of about 0.01 to 100  
3         milliamperes.

1           23. The system of Claim 22 wherein the AC signal is an AC  
2         current having a value in the range of about 0.01 to 10 amperes.

1           24. The system of Claim 18 wherein the light source is  
2         monochromatic, and further including a collimating lens  
3         collimating the beam.

1           25. The system of Claim 19 wherein the polarization  
2         modulator includes a Kerr cell.

1           26. The system of Claim 19 wherein the polarization  
2         modulator includes a Pockels cell.

1           27. A method of measuring glucose concentration in a  
2         sample, comprising the steps of:

3               (a) passing a beam of collimated light through a  
4         polarizer oriented in a first direction to polarize the light in

5       the first direction, a polarization modulator, an analyzer  
6       oriented in a second direction to polarize the light in a second  
7       direction, and a focusing lens, and then to a detector;

8                 (b) adjusting at least one of the polarizer and the  
9       analyzer to extinguish any light passing from the analyzer to the  
10      detector;

11                 (c) locating the sample between the polarizer and the  
12      analyzer; and

13                 (d) simultaneously applying a DC signal and an AC  
14      signal to the polarization modulator to extinguish any light  
15      passing from the analyzer to the detector, by shifting the DC  
16      signal to a value that produces a null in the AC component of an  
17      output signal produced by the detector, the value of the shifted  
18      DC signal then representing the glucose concentration in the  
19      sample.

1                 28. The method of Claim 27 wherein step (a) also includes  
2       passing the beam through a quarter wave plate after the  
3       polarizer.

1           29. The method of Claim 28 wherein step (d) includes  
2         applying the DC signal with the AC signal superimposed thereon to  
3         a coil of a Faraday rotator.

1           30. The method of Claim 29 wherein the DC signal is a DC  
2         current having a value in the range of about 0.01 to 200  
3         milliamperes.

1           31. The method of Claim 30 wherein the AC signal is an AC  
2         current having a value in the range of about 0.01 to 10 amperes,  
3         to thereby reduce noise to the range of a few millivolts or less.

1           32. The method of Claim 31 including applying the output  
2         signal produced by the detector to an input of a lock-in  
3         amplifier, and shifting the DC signal to a value that causes an  
4         output of the lock-in amplifier to have no DC component.

1           33. The method of Claim 28 including passing the beam  
2         through the aqueous humor of a human eye so that a portion of the  
3         beam passing through the aqueous humor is approximately parallel  
4         to an iris of the eye.

1           34. The method of Claim 28 including passing the beam  
2         through the aqueous humor of a human eye, by providing an input  
3         portion of the beam parallel to a tangent to the center of the  
4         cornea of the eye, causing the portion of the beam passing  
5         through the aqueous humor to be reflected from a point of the  
6         iris of the eye, the reflected portion of the beam emerging from  
7         the aqueous humor as an output beam which is substantially  
8         parallel to the input portion of the beam.

1           35. The method of Claim 34 wherein the output beam is  
2         substantially co-linear with the input portion of the beam.

1           36. The method of Claim 27 wherein the sample is a portion  
2         of a person's skin in vivo.

1           37. The method of Claim 36 wherein the ratio of the  
2 magnitude of the AC signal to the magnitude of the DC signal is  
3 in the range from about 10,000 to about 1,000,000.

1           38. A system for measuring glucose concentration in blood  
2 in a sample, comprising in combination:

3                 (a) a collimated light source producing a beam;

4                 (b) a polarizer oriented in a first direction to  
5 polarize light of the beam in the first direction;

6                 (c) a polarization modulator transmitting light from  
7 the quarter wave plate;

8                 (d) an analyzer polarizing light from the polarization  
9 modulator in a second direction;

10                 (e) a detector receiving light from the analyzer;

11                 (f) the sample being located between the polarization  
12 modulator and the analyzer; and

13                 (g) modulator control circuitry coupled to at least

14 one control terminal of the polarization modulator and operative  
15 to simultaneously apply a DC signal and an AC signal to the  
16 polarization modulator to extinguish any light passing through  
17 the analyzer to the detector by shifting the DC signal to a value  
18 that extinguishes any AC component of an output signal produced  
19 by the detector, the value of the shifted DC signal then  
20 representing the glucose concentration in the blood of the  
21 sample.

1 39. The system of Claim 38 including a quarter wave plate  
2 oriented in the first direction and transmitting the light  
3 polarized by the polarizer.

1 40. The system of Claim 39 wherein the modulator includes a  
2 Faraday rotator and the DC signal with an AC signal superimposed  
3 thereon is applied between the terminals of a coil of the Faraday  
4 rotator.

1 41. The system of Claim 40 wherein the DC signal is a DC  
2 current having a value in the range of about 0.01 to 100  
3 milliamperes.

1           42. The system of Claim 41 wherein the AC signal is an AC  
2       current having a value in the range of about 0.01 to 10 amperes.

1           43. The system of Claim 42 including a lock-in amplifier  
2       receiving a reference voltage and the output signal produced by  
3       the detector and operative to invert components of that signal  
4       lower than the reference voltage, filter a resulting signal  
5       including the non-inverted and inverted components of the output  
6       signal produced by the detector and filtering that signal.
